
(a)
Next portion $[k_0, k_1)$ of a rate group, ending at the page end, the barrier limit or the run end
Is any RX of the group active?
no
skip the page
yes
Are the linked TX committed through $k_1 + h_{FD}$?
no
shorten k_1 or wait
yes
Cut $[k_0, k_1)$ at snapshot-interval bounds and at the switch samples $k_{r,j}$
Render each segment: chord delay, exact carrier phase, FD filter
RX chain: noise, LO, front end; deliver; record
Cursor ← k_1; run due barriers; update command status
(b)
registered controller, barrier at t_b
unregistered client, late command
Controller
decide
ris.set_config at t_{req}
ctrl.barrier
ris.set_config at t_b+L, then ctrl.ack
$t' = \max_r\left(\text{frontier}_r / f_r - \tau_r\right)$
RIS (time t)
t_b
t_b+L_{min}
t_{sw}
t_{req}
t'
observation window
RX 1 (near) samples
k_1
frontier$_1$
RX 2 (far) samples
k_2
frontier$_2$
computed before the barrier runs
lateness 0 on every RX
lateness $k_{applied} - k_{req}$, status late_applied
requested sample k_{req}
applied sample $k_{applied}$
computed samples
